AI-Assisted Medical Summary

## 1. Diagnosis

Lung Fibrosis

## 2. Specialty

General Physician

## 3. Detailed Report

Condition Detected: Lung Fibrosis

The AI analysis of your 3D CT scan indicates a high probability of lung fibrosis, with a confidence score of 95.00%. This suggests that there is significant scarring and thickening of the lung tissue. The pattern seen on the scan is consistent with interstitial lung disease, possibly related to conditions such as idiopathic pulmonary fibrosis (IPF) or connective tissue disease. 3D CT scans enable a detailed visualization of lung structure in cross-sectional images, aiding in the identification of abnormal patterns. While this result strongly suggests lung fibrosis, it is not a definitive diagnosis. Possible next steps include further high-resolution CT scanning, pulmonary function tests, and possibly a lung biopsy. It's essential to rule out other potential causes.
